

Indian Institute of Science Education Research Kolkata

Mid-semester Examination:

CH4205 (Statistical Thermodynamics): 20/02/2019

Time: 10:00 am to 11:30 am

Full Marks: 20

- 1) Consider two, two-state paramagnetic systems. Each has total  $N$  ( $N_{\downarrow} + N_{\uparrow}$ ) = 25 spins. The two systems are in weak thermal contact with each other. System A starts with  $N_{\uparrow} = 10$  and system B starts with  $N_{\uparrow} = 15$ . Calculate entropy of system A, system B and the combined system in their initial states. **2 marks**
- 2) A rectangular box contains 100 molecules of a gas. What is the probability that all the molecules are situated in the leftmost 99% of the box? **2 marks**
- 3) Show that when two systems are in thermal equilibrium, then temperature of both the systems are equal. **3 marks**
- 4) Explain phase space,  $\mu$ -space and  $\tau$ -space. **3 marks**
- 5) **Classical harmonic oscillators in the microcanonical ensemble:**  
A system consists of  $N$  non-interacting harmonic oscillators with coordinates  $q_i$  and momenta  $p_i$ . The Hamiltonian reads

$$H = \sum_{i=1}^N \left( \frac{1}{2} p_i^2 + \frac{1}{2} q_i^2 \right)$$

i.e., the masses and frequencies of the oscillators are set to unity.

- a) Calculate energy  $E$  and the heat capacity  $C_v$  as functions of  $T$  and  $N$ . **3 marks**
- 6) **Entropy of  $N$  spin-1 atoms:**  
Consider a lattice with  $N$  (distinguishable) spin-1 atoms. Each atom can be in one of the three spin states  $S_z = -1, 0, +1$ . Let  $n_-$ ,  $n_0$ ,  $n_+$  denote the respective numbers of atoms in each of those spin states ( $N = n_- + n_0 + n_+$ )
  - a) Calculate the entropy as a function of  $n_-$ ,  $n_0$  and  $n_+$ . Use the Stirling formula to approximate the factorials.
  - b) Which macrostate, i.e., which  $n_-$ ,  $n_0$ ,  $n_+$  maximizes the entropy? **(2 + 2) marks**
- 7) Consider three spin  $\frac{1}{2}$  particle in a magnetic field  $H$  along  $z$  axis. Corresponding to the quantum number  $m_i$  of each spin, the particles have an energy  $\pm\mu H$  (energy of a magnetic moment  $\mu$  in a field  $H$  is  $-\mu H$ ). Calculate average moment of the first spin. **3 marks**

$$\begin{pmatrix} + & + & - \\ + & - & + \\ - & + & + \end{pmatrix}$$
